## Hack into the undeveloped area

With the development of the Internet, the world has changed a lot. However, the extension of it has been blocked by expensive cost of line and base station. After 41 hours development, here comes our technology to deal with it!

We build a customized ISP for local residents and multi-view SDK for developers. All the services in a village are supplied by our carriage system, in which the users can access to our network by wifi, the developers can monitor the distribution of their application and the data is updated by manpower.

We are not the  
innovator of  
Internet but the  
movers.

We supply not only  
network  
infrastructure,  
but also incubator  
of applications.
